CERTIFICATION

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

John P. Sullivan, P.E.
Chief Engineer

Dated: 1/25/2024

Section 1 – Introduction

Under the terms of the Consent Decree lodged in federal court on August 23, 2012, the Boston Water and Sewer Commission (BWSC) must implement a subcatchment screening program and establish priorities and a schedule for investigating subcatchments that demonstrate contamination.

As required under the Consent Decree, on November 20, 2012, the BWSC submitted: (a) a revised priority ranking of subcatchments based on information and data available at that time; (b) an MS4 and CSO subcatchment area map showing the revised ranking of each subcatchment; and (c) a schedule for completion of all subcatchment investigations.

Also under the Consent Decree, by January 31st of each calendar year, the BWSC must revise its priority ranking of subcatchments to be investigated to: (a) include all subcatchments newly identified as needing investigation based on evidence of discharges contaminated by human waste; and (b) adjust priorities based on new evidence. As required, revised priority rankings of subcatchments were submitted to EPA by January 31st, each year since 2013.

Pursuant to Section VII, Part B, Paragraph 17 of the Consent Decree, BWSC hereby submits this revised priority ranking of subcatchments as of January 2023. This document and the rankings incorporate agreed revisions proposed to EPA on August 15, 2014.

Section 2 – Screening Protocols

Protocols have been developed for both dry and wet weather screening of subcatchments. The protocols were updated in 2020 (wet) and 2021 (dry). Appendix A contains the dry weather screening protocols. Appendix B contains the wet weather screening protocols. The screening protocols were established for conducting visual inspections; screening and sampling of outfalls/interconnections; monitoring weather conditions and tides in order to select appropriate days to conduct screening and sampling visits; and mobilizing field staff. The protocols also defined required sampling procedures, including: specific parameters to be sampled in the field vs. in the lab, equipment calibration and operation, communications, record keeping, and health and safety concerns. The documents also include analytical requirements for collecting water quality samples, sample blanks, and duplicates; sample preservation and holding time requirements; and laboratory analytical quality assurance/quality control (QA/QC) procedures. In general, the following protocols were followed in 2023:

- Visual inspections were conducted to confirm outfall/interconnection locations, collect inspection data, and plan sampling.
- Screening was performed during dry and wet weather for collection of samples for field and lab analysis.
- Ammonia, surfactants, pH, temperature, specific conductivity, total chlorine and salinity were measured using field test kits.
- Samples were delivered by courier to G&L Laboratories for bacterial analysis.
- Bacterial analysis consisted of *E. coli* for freshwater samples and *Enterococci* for marine water samples.
- All samples were taken as grab samples. No confined space entry was required.

All the screening data in 2023 were collected by Commission's consultant, Stacey DePasquale Engineering, under sub-contract to Stantec, Inc.

The purpose of the dry weather sub-catchment screening and inventory effort was to:

- Confirm the location of the outfalls/interconnections.
- Characterize the current condition (size, material, flow, etc.) of each outfall or interconnection.
- Identify outfalls/interconnections with dry weather flow and determine if the flow was potentially contaminated.

The purpose of the wet weather screening was to collect a wet weather sample at all locations where flow was not observed during dry weather screening, as well as locations where dry weather flow was below the Illicit Discharge Detection and Elimination (IDDE) thresholds established by the Consent Decree.

IDDE screening thresholds as defined in the Commission's Consent Decree are as follows:

Bacteria:

<u>Class A and Class B waters</u>
E. coli: greater than 235 cfu/ 100 mL
Enterococcus: greater than 61 cfu/ 100 mL

<u>Class SA and Class SB waters</u>
Enterococcus: greater than 104 cfu/ 100 mL

Ammonia: = >0.5 mg/L
Surfactants: = > 0.25 mg/L via field kits; => 0.1 mg/L via laboratory analysis
Chlorine: greater than non-detect (0.02 mg/L method detection limit)

The 2023 wet weather screening followed the modified program set forth in the Commission's Proposed Wet Weather Outfall Monitoring Program, which was approved by EPA in a letter dated April 22, 2014. Under the modified program the same wet weather protocols, parameters and thresholds identified in the Consent Decree were used. However, in order to start wet weather screening earlier in the year the selection of subcatchments included in the 2023 wet weather program was based on the 2022 dry weather screening data.

Section 3 – 2023 Field Screening

There are 256 Commission-owned subcatchments, of which 210 are storm drain outfalls (SDOs)[1], 18 are storm drain manholes where storm drainage is conveyed to other municipalities' MS4s or non-BWSC outfalls (referred to as "interconnections"), and 28 are Combined Sewer Overflow (CSO) outfalls.[2]

[1] Subcatchment 25M005 has been fully separated and now conveys only drainage so it has been moved to the storm drain outfall list. 6DSDO184 was removed from the list of storm drain outfalls since it is a culvert and not a storm drain outfall.
[2] There are still 30 CSO outfalls listed in the BWSC's NPDES Permit. However, CSO 19MCSO083 has been eliminated; therefore, it was not screened in 2023. Outfall 25M005 was fully separated so it now appears on the storm drain outfall list.

All the results of the 2023 dry weather screening program are provided in Appendix C, and a summary of dry weather screening and sampling performed during 2023 is shown in Table 1.

Dry weather field screening took place at 30 CSO locations[3] in 2023. Dry weather samples were collected at 23 CSO locations. Seven (7) locations were not sampled because there was no flow or insufficient flow to sample, or the outfall had standing water or was submerged, and upstream manholes also had standing water or were submerged.

Dry weather screening took place at 232 SDO and interconnection locations during 2023. Four (4) SDOs had a second sample collected during screening. All these results are included in Appendix C. Dry weather samples were collected at 133 of the locations visited. The remaining 99 locations were not sampled because there was no flow or insufficient flow to sample; the outfall had standing water or was submerged, and upstream manholes also had standing water or were submerged; or the outfall and upstream features could not be accessed or located.

TABLE 1.

2023 Dry Weather Screening Samples Collected versus Not Collected

Results of Dry Weather Sampling CSOs	2023
Total CSO Screenings Performed	30
Samples Collected	23
Samples Not Collected	7
No flow, dry	2
No flow, standing water/submerged	5
Could not access outfall/no suitable sampling location	0
Results of Dry Weather Sampling SDO/Interconnections	**2023**
Total SDOs/Interconnect Screenings Performed	232
Samples Collected	133
Samples Not Collected	99
No flow, dry	67
No flow, standing water/submerged	30
Could not access outfall/no suitable sampling location	2

All results of the 2023 wet weather screening program are provided in Appendix D, and a summary of the wet weather screening and sampling performed is shown in Table 2.

Wet weather field screening took place at five (5) CSO locations during 2023. Wet weather samples were collected at four (4) of the CSO locations. The remaining one (1) location was not sampled because the outfall had standing water or was submerged and upstream manholes also had standing water or were submerged. Due to unsuitable weather conditions and tides crews were unable to screen five (5) CSO locations during wet weather until January 2024. Since the results were not back from the laboratory in time to include in this report, they are not included in Appendix D nor the Priority Ranking.

[3] The Stony Brook Conduit CSO 21HCSO046 was screened in three locations in 2023. All three locations are ranked in the 2023 prioritization.

Wet weather screening took place at 115 SDO and interconnection locations during 2023. Wet weather samples were collected at 96 of the locations visited. Samples could not be collected at 19 locations because there was no flow or insufficient flow to sample or the outfall had standing water or was submerged and upstream manholes also had standing water or were submerged. Due to unsuitable weather conditions and tides crews were unable to screen five (5) SDO locations during wet weather until January 2024. Since the results were not back from the laboratory in time to include in this report, they are not included in Appendix D nor the Priority Ranking.

TABLE 2.
2023 Wet Weather Screening Samples Collected versus Not Collected

Results of Wet Weather Sampling CSOs	2023
Total CSO Screenings Performed	5
Samples Collected	4
Samples Not Collected	1
No flow, dry	0
No flow, standing water/submerged	1
Could not access outfall/no suitable sampling location	0
Results of Wet Weather Sampling SDO/Interconnections	**2023**
Total SDOs/Interconnect Screenings Performed	115
Samples Collected	96
Samples Not Collected	19
No flow, dry/insufficient flow	4
No flow, standing water/submerged	15
Could not access outfall/no suitable sampling location	0

Section 4 – 2024 Ranking and Prioritization

As of August 23, 2019, illicit discharge investigations in all the Commission's subcatchments were complete. As a result, the prioritization methodology was updated for the 2021 priority ranking and continued in the 2022 and 2023 priority ranking as the Commission has moved toward a long-term IDDE maintenance program.

As required by the Consent Decree, 12 subcatchments discharging to beach areas were given first priority. Interconnections with other MS4s were ranked next, and then all remaining subcatchments followed. Subcatchments in each of these groupings were scored against four criteria as follows:

- Discharge location: Discharge to a beach or interconnection discharging to another MS4.
- Dry weather screening: Based on 2023 dry weather screening data. Considers flow conditions at sampling location, bacteria type, and bacteria result. Score is given based on where the bacteria result falls in the criteria table.
- Wet weather screening: If a wet weather sample is taken, it is currently weighted 20%, and the dry weather is weighted 60%. If no wet weather sample is taken, the dry weather is weighted 80%. A lack of a wet weather screening means that the threshold was already exceeded in the

dry weather sample from the previous year. Outfalls contaminated in dry weather are given the highest priority.

- Most recent inspection date: A score is assigned by comparing the most recent date of inspection (dye test or pipe inspection) to the criteria table. Areas that haven't had inspections since 2004, including the upper Stony Brook, receive a higher score.

Scores were assigned to each outfall in each of the four categories from zero to ten as indicated in Tables 3 through 6 below.

TABLE 3. Priority Ranking Criteria – Discharge Location

CRITERIA		SCORE
Discharge Location	Public Beach	10
	Interconnections	10
	Not a Public Beach or Interconnection	0

TABLE 4. Priority Ranking Criteria – Dry Weather Outfall Screening

CRITERIA			SCORE
Dry Weather Outfall Screening Flow Conditions and Bacteria Sampling Results	**E.coli**	**Enterococci**	
	≥80,000	≥80,000	10
	50,000 - 79,999	40,000 - 79,999	9
	40,000 - 49,999	30,000 - 39,999	8
	30,000 - 39,999	20,000 - 29,999	7
	20,000 - 29,999	10,000 - 19,999	6
	10,000 - 19,999	5,000 - 9,999	5
	5,000 - 9,999	1,000 - 4,999	4
	1,000 - 4,999	500 – 999	3
	235 - 999	104 – 499	2
	Standing Water/Submerged		1
	No Access/CNL		1
	<235	<104	0
	Dry		0

TABLE 5. Priority Ranking Criteria – Wet Weather Outfall Screening

CRITERIA			SCORE
Wet Weather Outfall Screening Flow Conditions and Bacteria Sampling Results	**E.coli**	**Enterococci**	
	≥80,000	≥80,000	10
	50,000 - 79,999	40,000 - 79,999	9
	40,000 - 49,999	30,000 - 39,999	8
	30,000 - 39,999	20,000 - 29,999	7
	20,000 - 29,999	10,000 - 19,999	6
	10,000 - 19,999	5,000 - 9,999	5
	5,000 - 9,999	1,000 - 4,999	4
	1,000 - 4,999	500 – 999	3
	235 - 999	104 – 499	2
	Standing Water/Submerged		1
	No Access/CNL		1
	<235	<104	0
	Dry		NA
	Not Required/Incomplete		NA

TABLE 6. Priority Ranking Criteria – Date of Last Inspection

CRITERIA		SCORE
Date of Last Manhole or Building Inspection	Prior to November 2004 (SBI)	10
	Nov 2004 - Dec 2012 (CWI1/2)	5
	Jan 2013 - present (CWI3/4/5)	0

Each of the four criteria were weighted in accordance with Table 7 to arrive at an overall score for each outfall. The weighting is such that the 2023 outfall screening results as a whole account for 80% of the score, regardless of whether wet weather screening was required. For locations that had a field duplicate bacteria sample collected or were sampled more than once, the higher bacteria result was used for prioritization purposes.

TABLE 7. Criteria Weighting

CRITERIA	Weight with 2023 wet weather screening data	Weight without 2023 wet weather screening data
Discharge Location	10%	10%
Dry Weather Outfall Screening	60%	80%
Wet Weather Outfall Screening	20%	0%
Date of Last Inspection	10%	10%

The 2024 Priority Ranking includes a scoring, ranking, and color-coding scheme as follows:

TABLE 8. Scoring, Ranking and Color-Coding Scheme

RANKING	RANKING SCORE	NUMBER OF SUBCATCHMENTS BY RANK	MAP COLOR CODE
1	Beach	12	Orange
2	Interconnection	16	Yellow
3	High >= 2	47	Green
4	Medium < 2 and > = 1	82	Blue
5	Low < 1	102	Purple
6	CSO or Unranked	NA	Gray

The results of the 2024 priority ranking are shown in Table 9 and a map illustrating the 2024 rankings of the subcatchments is provided as Figure 1.

Section 5 – Follow-up Illicit Discharge Investigations

Although investigations in all of the Commission's subcatchments were completed as of August 23, 2019, recent outfall screening results show discharges from some subcatchments still demonstrate levels of contamination above the thresholds established in the Consent Decree.

In August 2020, the Commission contracted with Stantec, Inc. to perform the next phase of its Illicit Connection Investigation Program (Phase 5). The primary purpose of Phase 5 is to perform follow-up investigations in subcatchments still demonstrating elevated levels of contamination, and to explore alternative methods for identifying sources of sewage contamination in the Commission's storm drain system. The CWI5 contract includes annual wet and dry weather field screening of the Commission's outfalls and interconnections, field investigations to identify illicit connections, and annual compilation of field screening data to produce Revised Priority Rankings of subcatchments to provide to EPA by January 31, each year. The duration of the Phase 5 contract has been extended until December 31, 2024.

During Phase 5 the Commission is focusing efforts on investigating subcatchments that discharge to beach outfalls, interconnections, and those that have a ranking equal to or greater than 2, as shown in Table 9. During 2023, follow-up investigations focused heavily on the Upper Stony Brook catchments, 13LSDO090, 07HSDO105, 07HSDO285, 12BSDO124 and 18GSDO233. In addition to the Commission's standard manhole sampling procedures, bacteria samples were collected in addition to field test kits at strategic locations to further prioritize sub-areas within some of the large subcatchments and to pinpoint remaining sources of contamination. During 2024, the Commission will continue to focus its investigative efforts on those subcatchments with the highest priority rankings.

NOTES:

[A]Outfalls in Bold were prioritized by EPA in 2014

[B]Outfalls with Date of Last Inspection "NA" were complete based on outfall screening and did not require upstream investgation of manholes or buildings. Outfalls listed as "Pre-Consent Decree" were completed prior to lodging of the Consent Decree in August 2012.

INTRODUCTION

The purpose of this document is to outline field procedures to perform dry weather outfall screening and sampling of the Boston Water and Sewer Commission's (Commission's or BWSC's) storm drain outfalls (SDOs), combined sewer overflow outfalls (CSOs), and storm drain interconnections between the Commission and storm drains owned by other Municipal Separate Storm Sewer Systems (MS4s). This document was originally developed in 2010 under Phase 2 and has been revised numerous times as the program evolved, primarily capturing changes to the list of outfalls to be screened. Appendix A provides a history of revisions. A significant update was completed in November of 2020. At that time the protocols were revised to capture changes to the sample collection and analysis procedures that had occurred over time, to update the definition of dry weather, to address locations that have not been sampled in the past due to standing water or other reasons, and to include an updated health and safety plan addressing impacts of COVID-19. This January 2023 revision includes two changes to the list of outfalls to be screened. Outfall 25MCSO005 was moved from the list of CSOs to the list of SDOs, as separation work was completed during 2022 and the outfall now conveys only stormwater. A note was added for outfall 6DSDO184 because it appears to be a cross-culvert only with no connected storm drain infrastructure. It remains on the SDO list but does not require screening.

The goal of the dry weather outfall screening program is to identify locations with dry weather flow and determine if the flow is contaminated. Screening will consist of recording weather conditions, characterizing each location's current condition (size, material, defects, etc.), observing visual and olfactory characteristics of dry weather flow, and collecting samples to be analyzed for bacteria and other parameters as discussed below.

Stacey DePasquale Engineering, Inc. (SDE), under contract to Stantec, will perform the outfall screening field work. SDE has been completing dry weather outfall screening and sampling for the Commission since 2010 and is therefore familiar with each sampling location. The current (2023) list of approved storm drain outfalls (Table B-1), interconnections (Table B-2), and CSO outfalls (Table B-3) are included in Appendix B. The interconnection sampling locations will be storm drain manholes.

Each outfall will be identified by its unique outfall Facility ID, and interconnections will be identified by their unique manhole Facility ID, as shown in Appendix B.

WEATHER AND TIDE MONITORING

SDE will continuously monitor (and keep records of) weather forecasts as a basis for determining when a period of acceptable dry weather exists in order to mobilize field crews to perform the dry weather screening. "Screening and Sampling" as described below may proceed under the following conditions:

Less than 0.1 inch of rainfall in the preceding 24 hours.

SDE will use the Commission's rain gauges to confirm that dry weather conditions have been met prior to mobilizing. For tidal locations, Screening and Sampling must be performed near low tide.

SCREENING AND SAMPLING

One day prior to screening and sampling visits, SDE will notify the laboratory and the courier of the schedule for the sampling day.

Sampling Location

A two-person field crew will conduct the screening and sampling by visiting the location of each outfall or interconnection manhole. In cases where the outfall is accessible and is not submerged, the outfall itself will be used for screening and sampling. The field crew will re-assess the recommended sampling location each year to determine if it is suitable. The Commission prefers to get the sample at the outfall if possible.

It is known that some outfalls will not be accessible and that some locations will be in areas subject to tidal inflows or will otherwise be subject to backwater effects. For these outfall locations field crews will locate a suitable screening site in an upstream manhole. The selected manhole will be as near the outfall as possible and free of standing water or back flow from the receiving water. It is anticipated that selected manholes in these cases will be no more than three manholes or 750 feet upstream outside of backflow or tidal influence.

For locations that are submerged or have standing water present[1], SDE will inspect up to three manholes directly upgradient but no more than 750 feet from the outlet. SDE will note which of these locations also has

[1]The term "submerged" is typically used only for outfalls and means that the outfall opening is below the water level of the receiving water. The term "standing water" means there is water present at the invert which is not flowing, and at least a portion of the outfall opening is above the water level of the receiving water. Standing water occurs at both outfalls and manholes but is more common at manholes.

standing water and then, at the first upstream accessible manhole location from the outfall free of standing water, perform the same data recording and sampling as described below. If all manholes inspected upstream of the outfall contain standing water, then a sample will not be collected. Outfalls that are unable to be sampled because they are submerged or have standing water must be reported to the Commission so that an alternate sampling location may be identified. Based on historical outfall screening data, a list of outfalls that are typically submerged or have standing water are provided in Appendix C with recommendations on how to proceed. Recommendations include CCTV, cleaning, continuing investigations upstream with multiple sampling points, and coordinating with other MS4s to improve mapping and confirm system ownership. In the meantime, SDE should continue to visit these outfalls and attempt to identify a suitable sampling location.

If an upstream manhole is used for screening and sampling SDE will note if there is more than one inlet to the manhole as well as the flow characteristics from each pipe. It is important at CSO outfalls to collect a sample at a manhole downstream of the regulator.

Data Collection and Reporting

All observations and activities conducted at each screening location will be recorded on the screening and sampling form included in Appendix D, including the Manhole Facility ID numbers of structures unsuitable for screening and sampling along with the reason for unsuitability. Forms will be completed electronically. Data will be exported to a spreadsheet and paper reports will also be generated and posted on the project SharePoint site on a weekly basis.

Photos will include both close-up and locational shots where possible. The field crew will also record dimensions, shape, material (e.g., concrete, PVC), physical condition, and presence and location of an outfall sign. The outfall signs are posted in various locations depending on the surroundings at each site.

At each location where flow is observed, an observation of flow characteristics will be recorded (odor, color, clarity, turbidity, deposits/stains). Samples will be collected for laboratory analysis of the dry-weather flow for either *E. coli* bacteria or *Enterococcus* bacteria. Tables provided in Appendix B designate each outfall and interconnection location as discharging to fresh or marine waters. Discharges to fresh water bodies shall be sampled for *E. coli* analysis, and those discharging to marine water bodies shall be sampled for *Enterococcus* analysis.

Analytical samples collected will be immediately labeled, sealed, and stored in ice-filled coolers. Samples will be transferred to G&L Laboratories of Quincy, MA for analysis within six hours of sample collection. Completed chains of custody will accompany each shipment to the lab. It is estimated that between 6 and 12 samples will be collected per day for a single crew, depending on distance among outfall locations. All samples will be collected in accordance with the detailed sampling procedures below.

In addition to each analytical sample collected, the field crews will estimate the flow and collect a sample for on-site evaluation of the following parameters:

- Temperature,
- pH,
- Specific Conductivity,
- Surfactants,
- Ammonia,
- Total Residual Chlorine,
- Salinity.

SAMPLING PROCEDURES

The following procedure outlines, in detail, the steps to be taken during outfall and interconnection screening and sampling:

- Prior to the start of sampling, a trip blank sample must be prepared by filling a laboratory-provided sample container with clean bottled water (distilled or bottled drinking water is acceptable). This trip blank sample will be labeled and kept in a cooler with all samples collected that particular day.
- Upon arrival at the appropriate screening location, begin a new Screening and Sampling Form. Blank forms are included in Appendix D.
- Indicate whether the screening location is a storm drain outfall, combined sewer overflow outfall, or interconnection manhole.
- Record all pertinent observational information, including a general description of flow velocity, depth of water, appearance of water, etc. *Note: flow rate will not be calculated in the field during inspections because it would significantly slow down the inspection process. However, flow can be calculated after-the-fact based on information that SDE records in the field during inspections, including the estimated velocity, the diameter of the outfall, and the approximate depth of water.*
- If outfall sampling location is a manhole, complete information related to manhole appearance and condition.
- Record the time of sampling.
- Place a clean grab sampling container into the middle of the flow stream facing upstream. Retrieve the container after it has filled and swirl the contents to coat all inside surfaces with sample water. Dump the contents of the container away from or downstream of sampling location. Repeat this twice, so that sample container is fully rinsed with sample water three times.
- Using the same method, fill and retrieve the sample container a fourth time. Gently swirl container to maintain mixing of the grab sample.
- Open the sterile container for bacterial sampling. Use caution to handle only the outside of each sample container and to maintain sterile conditions during collection of bacterial samples. Fill sterile container with sample water and seal container. If duplicate samples are being collected at a particular location, they should be poured from the same container. The appropriate analysis will be conducted at sample locations as follows:
    - *E. coli* – freshwater discharge locations;
    - *Enterococcus* – marine discharge locations.
- Verify that the sample container is properly sealed and label each sample container with sample identifier, date, time, preservative type (ice only), and initials of sampling personnel. Duplicate samples shall be labeled with a “D” preceding the sample identifier. All information shall be also recorded on the field form.
- Place sample containers in ice-filled coolers until later transport to the lab takes place.
- Conduct on-site measurements of field parameters on remaining volume in sample container. If more volume is needed, a subsequent grab sample may be collected in the manner described for analytical sample collection.

1. Test kits will be used for field measurements of surfactants, ammonia, and total residual chlorine as follows:
    - Ammonia: CHEMetrics K-1510 or Hach Ammonia (Nitrogen) test strips,
    - Surfactants: CHEMetrics K-9400
    - Total Residual Chlorine: CHEMetrics K-2504
2. Oakton PCTSTesr50, a portable meter, will be used for measurements of pH, salinity, temperature, and specific conductivity. (Note that instrumentation shall be checked and calibrated at least bi-weekly.)

- Gently swirl the container to maintain mixing.
- Use manufacture instructions to run the sample for the required field parameters.
- Record results and time of measurements on the field form.
- Clean and store meter during travel between sampling locations.
- For any reusable sampling equipment, decontamination shall be performed as follows:
    1. Rinse equipment with a 70% isopropyl alcohol solution. Rinsate shall be collected in a bucket and disposed of properly.
    2. Rinse equipment with distilled water.
- Note that samples must be transferred to G&L Laboratories within six hours of sample collection, and samples must be analyzed within an **eight-hour holding time** from sample collection.
- Prior to transfer to the lab, a chain of custody shall be filled out and must accompany samples at all times. The person receiving samples at the lab must sign each chain of custody.

QUALITY ASSURANCE/QUALITY CONTROL

This Quality Assurance/Quality Control (QA/QC) section will establish the data quality objectives (DQOs) for the program, as follows:

- Data must be complete and of sufficient detail to assess water quality at each screening location.
- Data should represent actual conditions at the outfall outlet or interconnection manhole inlet.
- Data should be generated by accepted sampling methodologies.
- Data must be reproducible and accurate.

The screening and sampling program has been developed to encompass these DQOs as they pertain to characterizing the physical condition and water quality at each screening location. Sampling techniques selected were based upon past methods employed in the Boston Water & Sewer Commission's monitoring programs and upon standard industry practice. Field crew members from SDE have prior experience with sample methods and equipment usage. The methods proposed for field testing are standard methods, as stated in EPA guidance (EPA, 1986; 2002; 2014). In addition, G&L Laboratories is State and EPA certified to conduct the required analyses.

Table 1-1 lists the analytical methods to be used for each of the parameters to be tested.

Table 1-1: Analytical Methods to be used for Bacterial Analysis

Parameter	Analytical Method
E. Coli	EPA 1603
Enterococcus	EPA1600

Measures employed to ensure that QA/QC DQOs are met are described as follows.

Precision

Precision is the ability to obtain reproducible results when analyzing duplicate samples. The overall sampling precision will be determined by the collection and analysis of field duplicate samples that are not identified as such to the analytical laboratory. Duplicate samples will be collected for the same analysis as the parent samples. They will be assigned an identical sample identifier, except for the addition of “D” preceding the identifier. Duplicate samples are to be collected at the frequency of one per twenty samples.

Because bacteria are living organisms that reproduce and die after sample collection, some degree of disparity between the duplicate sample and the original sample is expected and not necessarily reflective of sample collection or laboratory error.

Accuracy

Accuracy is the degree of difference between a reported value and its true value. As part of ensuring sufficient accuracy, minimization of false positive and false negative analytical data is attempted.

The potential for false positive data values will be assessed through the analysis of laboratory blanks, which must be less than the method detection limit (MDL) or instrument detection limit. Each batch of samples analyzed will be run with a laboratory blank.

Accuracy will also be assessed through the use of control samples of known composition. Laboratory control samples and calibration standards will be used by the laboratory, as needed.

Representativeness

Sample collection under this program is intended to provide data representative of actual conditions at particular screening locations. In order to ensure representativeness, outfall sample locations are selected as close to actual outfall outlets as possible. Where an outfall is unsuitable for sampling at its outlet due to inaccessibility, tidal inflows, or backwater effects, locations upstream may be selected with prior Commission approval only. However, since grab samples are only representative of a snapshot of water quality conditions at a given point in time, they may not be representative of long-term conditions. Data collected must be evaluated while recognizing this limitation.

In addition, samples collected must be representative of water quality at the location they were taken and not be influenced by cross-contamination from other samples collected the same day and stored in the same ice cooler. In order to ensure this, trip blank samples must be collected at the start of each day by filling a laboratory-provided container with clean bottled water. This filled container will be carried throughout the day in the same ice cooler with samples collected.

Sample Handling and Custody

All filled sample containers will be placed on ice immediately following sample collection. They shall then be transported to the lab, G&L Laboratories, within six hours for analysis within 8 hours. (Note that the holding time is applicable from time of sample collection to time of analysis.) A completed chain of custody must accompany each sample shipment to the lab, and sample custody will be tracked throughout the full analytical process in the lab. These forms will be included in the analytical report to Stantec. Table 1-2 lists required types of containers and preservation for each analysis to be performed.

Table 1-2: Requirements for Sample Holding

Parameter	Container Volume	Container Type	Preservative	Holding Time
E. Coli	100 mL	Sterile plastic	Cooled to <10°C	8 hours
Enterococcus	100 mL	Sterile plastic	Cooled to <10°C	8 hours

Instrument/Equipment Testing, Inspection, and Maintenance

Testing, inspection, and maintenance will be performed for all instruments and equipment to be employed for the lab analyses to be conducted as part of this program, and such activities will be done in accordance with G&L Laboratories' quality procedures.

All field sampling equipment and instrumentation will be inspected on a regular basis, and preventative maintenance will be performed. Prior to mobilization to the field sites, equipment and instrumentation will be checked and calibrated in the office. Following each sampling event, all field equipment and instrumentation will be cleaned and stored properly.

Performance Audits and Corrective Actions

Periodic audits of the field program will be conducted by Stantec at the start of the screening and sampling activities and on a random basis to evaluate adherence to and appropriateness of QA/QC requirements in the field. If unacceptable conditions are noted, Stantec and SDE will initiate corrective actions together. These corrective actions may include:

- Re-analyzing samples (if holding times permit doing so);
- Re-sampling and subsequent analysis;
- Evaluating and amending sampling and analytical procedures;
- Accepting potentially flawed data with acknowledgement of uncertainty or inaccuracy by flagging of data and providing a qualifying explanation.

GENERAL FIELD REQUIREMENTS

Any major blockages, collapses, or defects to the storm drainage system or sanitary sewer system (that may pose a public health and safety threat) observed during any field operations will be reported to the Commission with 48 hours.

Field crews are authorized to request a police detail for personal safety reasons at any time.

SDE's Health and Safety Plan is provided in Appendix E and has been updated to include COVID-19 protocols. The Commission does not require safety vests to be issued by the Commission, but crews must have safety vests and they must be worn in the field.

APPENDIX A

History of Revisions to Dry Weather Outfall Screening Protocols

APPENDIX A

History of Revisions to Dry Weather Outfall Screening Protocols

1/20/2023	Outfall 25MCSO005 separation was completed in the tributary area in the latter part of 2022 and it now conveys only stormwater. GIS updates have not been made yet.
12/28/2021	Outfall 06DSDO184 appears to be a cross-culvert only with no connected storm drain infrastructure. Keep on SDO list but screening not required.
3/23/2021	Add new storm drain outfall 26LSDO109.
2/18/2021	Add new storm drain outfall 12HSDO2. It was built by others but is now owned by BWSC.
11/12/2020	CWI5 Kickoff Updates: • Stantec review of EPA Methods 1600 and 1603 revised 2014 (prior protocols based on 2002 versions). Revisions made accordingly, including update of sample holding time to clarify that samples must be delivered to the lab within 6 hours from the time of sample collection and analyzed by the lab within 8 hours from the time of sample collection. Also updated sample preservation temperature from 4 ^{o}C to <10 ^{o}C. • Updated field instrument and test kit manufacturer/model, and calibration frequency • Updated the definition of dry weather to align with the MA Small MS4 permit (change from less than 0.1 inches of rain in the prior 48 hours, to less than 0.1 inches of rain in the prior 24 hours) • Additional information/guidance provided for locations that are consistently submerged or have standing water present during dry weather screening • Updated Outfall Screening Form • Add SDE Health and Safety Plan, including information about COVID safety measures
3/14/2019	21HSDO001 and 21HSDO002 were added as a result of the Muddy Brook Restoration Project.
2/21/2017	19MCSO083 has been abandoned and does not need to be screened anymore.
11/20/2015	Add two new South Street storm drain outfalls 13FSDO96 and 13FSDO97 to the list of outfalls to be screened during 2015 (Appendix B). Map added to Appendix C.
6/24/2015	Add new Hyde Park storm drain outfall 8FSDO1 to the list of outfalls to be screened during 2015 (Appendix B). This outfall was previously private; now confirmed owned by BWSC. Map added to Appendix C.
3/26/2015	Add new East Boston storm drain outfall 29PSDO005 to the list of outfalls to be screened during 2015 (Appendix B). Map added to Appendix C.
6/23/2014	Add two SDOs to the list of outfalls for 2014 dry weather screening: • 20GSDO164/2007640005 (previously thought to be owned by DCR) • 4FSDO1/406640010

5/9/2014	Add 24LSDO22/2412640005 to list of outfalls for dry weather 2014. Change designation of 26KSDO35, 26KSDO050 and 26JSDO049 to Marine.
4/11/2014	Remove 7HSDO287 from the list because during 2013 dry weather screening SDE determined that this outfall is no longer active; the outlet from the upstream catch basin has been bricked and flows are directed to 7HSDO285.
3/13/2014	Replaced 26KSDO245 with 26KSDO254. It was determined that 26KSDO245 belongs to DCR. Also replaced interconnection 21DMH055 with 20DNP140, an unmapped manhole near 42 Strathmore Road that has been sampled in the past.
2/19/2014	Updated Facility ID and Feature ID for 25MSDO007, 26JSDO049, and 21NCSO80. Updated Facility ID for 25MSDO006.
1/20/2014	Added outfall 24CSDO039 to replace interconnection 24CMH14, which was sampled in 2012 and 2013.
10/3/2013	Changed Interconnections 12LMH374 and 12LMH204 to Marine.
8/12/2013	Changed 26JCSO049, 26JSDO101, and 26KSDO050 from Fresh water to Marine.
5/20/2013	Six outfalls that were previously removed or "Pending Approval" were added back to the list of approved outfalls for sampling. These outfalls are the following: 12BSDO010, 12BSDO031, 12BSDO033, 07HSDO287, 28LSDO073, and 28LSDO077. SDE should attempt to screen these outfalls for the 2013 round of dry weather screening. If the outfall is inaccessible and there is no upstream manhole just observations should be noted on the screening form.
4/12/2013	Updated the facility ID for outfall 7CSDO006.
4/8/2013	Six outfalls that had not previously been located were investigated by BWSC and have been removed from the list for sampling. These outfalls are the following: 12BSDO031, 12BSDO033, 20LSDO081, 20LSDO083, 29PSDO015, and 21HSDO201. Three outfalls are still under investigation and have been moved to "Pending Approval". These outfalls are the following: 12BSDO010, 28LSDO073, and 28LSDO077.
3/25/2013	Stony Brook Outfall 21HCSO046 was added to the approved outfall list. Maps for three approved sampling locations were attached.
2/12/2013	SDE was authorized to begin the second (2013) round of dry weather screening on 1/14/2013. The tables in Appendix B have been revised to show approved SDOs, CSO outfalls and interconnections for 2013 dry weather screening. This includes changing interconnection 28MMH15 to 28IMH15. Despite the label being incorrect, the correct manhole was sampled in the past. On 2/12/2013 SDE was reminded to collect field duplicate samples in one container and then pour from the one container into two separate sample bottles. Prior to this field duplicates had been collected separately.
12/13/2012	Added approved 21HCSO046 and Interconnection 20DMH062 to the list in Appendix B. SDE is approved to take three samples at 21HCSO046 as discussed in the meeting on 12/5/12. SDE is also approved to return to Interconnection 20DMH055 and take a sample at a downstream manhole.
12/4/2012	Added SDO 24L057 to the list of approved outfalls. Added Map 9 (old map) and Map 10 (new map). The old map shows the outfall as existing, but new GIS shows the drainage being diverted to CSO 060. No plans confirmed this change, so SDE is approved to check to see if the outfall exists. MH 24L056 should be inspected for an outlet, and if that cannot be located MH24L056 should be sampled.

11/19/2012	Added one approved SDO to the list in Appendix B: 26L106.
10/23/2012	Added six approved CSOs to the list in Appendix B: BOS 081, BOS 082, BOS 083, BOS 084, BOS 085, and BOS 086.
10/2/2012	Added storm drain outfall 26L070 to list of approved SDOs in Appendix B.
9/24/2012	Added special maps for outfalls 08B122 and 26K050 to Appendix C.
9/17/2012	The Fort Point Channel Outfalls were approved for dry weather screening during the August 29th technical progress meeting. In addition, select CSOs and interconnections were approved for dry weather screening during a September 6th working meeting (to commence after dry weather screening of all storm drain outfalls is complete). Approved locations can be found in Appendix B. Other changes to Appendix B Tables: SDO 12L296 was moved to the interconnection list Six not approved SDOs were added to the bottom of the SDO list for reference The sampling method for E. coli was also changed from SM9213 to EPA 1603.
7/27/2012	Protocols were revised July 27, 2012 to put Fort Point Channel Outfalls on hold until further notice. See Appendix B.
7/25/2012	SDE is authorized to begin dry weather screening at storm drain outfalls only starting on Monday 7/30/2012

21HCSO046-1	2.109E+09	BOS 046	Fens Gate House (drains stony brook); Three locations approved include 15GMH290, 19HMH222, and 23IMH1	Fenway		Muddy River	B-CSO	Fresh

Note: There are 30 CSO Outfalls in the Commission's NPDES Permit. However, CSO 19MCSO083 has been eliminated, therefore it is no longer screened and CSO 25MCSO005 has been separated and is now screened as an SDO.

APPENDIX C

Recommendations for Locations with Standing Water

Appendix C
Table C-1
2021 Dry Weather Screening
Recommendations for Locations Historically Unable to Sample due to Standing Water

Recommendation	Outfall ID	Comments
CCTV	6DSDO184	Upstream features have never been located; mapping is likely incorrect. Attempt to CCTV from the outfall upstream to locate upstream structures.
Clean	28IMH15	Standing water all the way up to the starter
	6DSDO91	Small catchment with just a couple of catch basins that always have standing water
Continue Upstream	11BSDO123	Outfall always 100% submerged, upstream MHs also have standing water. Attempt to locate/check 11BMH73 on the East side of VFW Parkway (this may be the most downstream manhole owned by BWSC anyway).
	25ESDO037	Standing water upstream to 25EMH131. If we continue further upstream the system branches off so it will require multiple samples. Possibly at Western Ave MHs 25EMH222 and 25EMH129.
	5FSDO245	Standing water observed up to 5FMH210. Could continue further but will have to collect multiple samples. Possibly at west inlet to 5FMH210 and also upstream along Hyde Park Ave.
Coordinate with MassDOT to see if they have better mapping of this area and to confirm ownership	27JSDO001	Standing water observed up to 27JMH17, and the system has already branched at this point so it would require multiple samples if we continue further upstream. Note - SDE was able to sample during wet weather a few times. Mapping is not good, and DOT may own portions of this catchment area.
	27JSDO096	Standing water observed up to 27JMH94 which has 4 inlets, so it would require multiple samples if we continue upstream. Mapping is not good, and DOT may own portions of this catchment area.

Note: This table contains outfall and interconnections that could not be sampled during dry weather due to standing water or being submerged between 2016 and 2020.

1.0 General Safety

While in the office or out in the field, all SDE personnel are to refrain from using horseplay and distracting others. Horseplay, scuffling, distraction of fellow workers, throwing of objects, running, and practical jokes may lead to serious injuries. Possession, consumption, or being under the influence of alcohol or drugs is also prohibited during working hours.

- Conduct a daily site hazard review each morning. Document the review using the Daily Hazard Review Meeting survey.
- Conduct an equipment check each morning. Document any issues found using the Daily Hazard Review Meeting survey. Tools, equipment, and supplies should be in good working order without any noticeable signs of damage or structural wear. If damage or wear is noticed a supervisor should be notified and equipment should be replaced prior to use.
- Conduct a check on all personal protective equipment to be used each morning. Document the check using the Daily Hazard Review Meeting survey. If any issues are found a supervisor should be notified. Personal protective equipment should be replaced before use.
- Site work should be performed during daylight hours whenever possible. Work conducted during hours of darkness require enough illumination intensity to read a newspaper without difficulty.
- Good housekeeping must be maintained at all times in all project work areas.
- Common paths of travel should be established and kept free from the accumulation of materials.
- Tools, equipment, materials, and supplies shall be stored in an orderly manner.
- As work progresses, scrap and unessential materials must be neatly stored or removed from the work area.

If unsafe conditions are present, SDE personnel have authority to stop work immediately. Hazardous conditions should be reported to supervisor as soon as it can be done safely.

2.0 Personal Security and Crime Prevention

While conducting your work stay alert, become familiar with your surroundings, report any activity/circumstances that you feel is unusual and always stay in frequent contact with other project personnel. Use the following to help protect yourself from danger while in/out of your vehicle, working alone or in an unsafe area:

- Avoid working alone as much as possible.
- When working at night on the project, plan for extra precautions such as additional lighting, security, police presence or escorts when leaving the project.
- If you are a witness or the victim of a crime, an accident or suspicious/threatening circumstances, report it to the Police as soon as possible.

- Always lock your car doors while driving, and roll windows up far enough to keep anyone from reaching inside.
- At stop signs and lights keep the car in gear, windows rolled up, doors locked and stay alert.
- Travel well-lighted, busy streets. You can spare those extra minutes it may take to avoid an unsafe area.
- Keep your wallet/purse, laptop, and other valuable out of sight, even when you are driving in your locked car.
- Park in safe, well-lighted areas near your destination.
- Always let a project member know where you are and your destination if you must travel alone.
- Always lock your car, even for a short absence. And before unlocking your car, quickly check to make sure no one is hiding on your seats or floors of your vehicle.
- If your car should break down:
  - Get off the roadway, out of the path of oncoming traffic, even if you have to drive on a flat tire. The tire is replaceable.
  - Turn on your emergency flashers.
  - If a motorist stops to render assistance, it is better to remain in the car, and ask them to get help.
  -

3.0 Working Alone

Working alone may not be hazardous in itself, but the work conditions or tasks to be performed on a project site may affect a person's ability to safely perform the work alone or to receive assistance in the event of an emergency.

Personnel can be assigned to work alone only by their project manager, who must assess potential hazards and appropriate control measures.

Listed below are some examples, not all-inclusive, of workplace conditions that must be considered and impact the ability of the employee to safely work alone:

- Is the amount of time needed for the employee to complete the task reasonable, or will fatigue become a factor?
- Do tasks include handling and lifting materials; operating machinery or powered tools; maintaining electrical, pneumatic, or steam powered systems; or working with hazardous substances?
- Is access to the work area difficult, requiring working at heights, below ground, or in structures that are difficult to enter or exit?

- Does the work location present a risk of violence to the employee; require travel off public roads through desolate or steep terrain; or involve work at a remote location or over or near rivers, pools, or lakes?
- What are the environmental conditions, such as temperature extremes or weather conditions?
- Must the work be performed beyond normal business hours or on weekends or holidays?
- Is the person working alone able to communicate with another employee in the event of an emergency or are emergency services readily available?

Examples (not all-inclusive) of precautionary or control measures that can be used to address the conditions or hazards of working alone:

- Conducting a review of the work schedule to determine whether the task could be completed during a time when the employee does not have to work alone.
- Establishing a communication process that will reliably allow contact with the employee working alone, requires check-in at designated time intervals, includes response actions when communication is lost or check-in is not completed, and verifies the employee has returned to their base of operation after completing the task.
- Requiring supervisors to periodically visit and observe worksites where employees work alone.
- Issuing the proper personal protective equipment (PPE) to the employee and ensure it is maintained in acceptable condition.
- Ensuring emergency supplies are provided for employee to use in event of fire, injury/illness, or survival provisions when working in a remote area.

4.0 Personal Protective Equipment

- Long pants, safety shoes (steel toe with non-skid soles), and safety vests are to be worn at all work sites unless specifically instructed otherwise.
- Hard hats to be worn in all construction zones although none are anticipated to be encountered during this project.
- Latex gloves are to be used when handling bacteria samples.
- Conduct a daily check of all PPE to be used to ensure it is in good condition. If anything is not in good working order it should be replaced before use. Checks should include:
    - Check latex gloves to ensure that they are not damaged. Check for holes, yellowing or other defects.
    - Check work gloves to ensure there is no noticeable damage including holes or fraying.
    - Check safety vest to ensure that they are clean, and that reflective material is not damaged.
    - Check safety cones for structural damage. Also check the reflective material to ensure it is in good condition and not damaged, discolored or peeling off.

- Check expiration date on bug spray.
- Check expiration date on Tecnu.

5.0 Cold Stress

- Be aware of the symptoms of cold-related disorders, and wear proper, layered clothing for the anticipated fieldwork. Appropriate rain gear is a must in cool weather.
- Monitor the work conditions and adjust the work schedule as needed.

6.0 Heat Stress

- Drink 16 ounces of water before beginning work. Under severe conditions, drink 1 to 2 cups every 20 minutes, for a total of 1 to 2 gallons per day. Do not use alcohol in place of water or other nonalcoholic fluids. Decrease your intake of or avoid consumption of coffee, carbohydrate-rich beverages, and caffeinated soft drinks during working hours.
- Acclimate yourself by slowly increasing workloads (e.g., do not begin with extremely demanding activities).
- Conduct field activities in the early morning or evening and rotate shifts of workers, if possible.
- Avoid direct sun whenever possible, which can decrease physical efficiency and increase the probability of heat stress. Take regular breaks in a cool, shaded area.

7.0 Roadway Work Safety

Work along/in roadways must be done according to local/state/federal requirements.
The following precautions must be taken when working around traffic:

- Exercise caution when exiting traveled way or parking along street – avoid sudden stops, use flashers, etc.
- Park in a manner that will allow for safe exit from vehicle, and where practicable, park vehicle so that it can serve as a barrier.
- All staff working adjacent to traveled way or within work area must wear the appropriate ANSI/ISEA 107-2004 high-visibility safety vests.
- Remain aware of factors that influence traffic related hazards and required controls – sun glare, rain, wind, flash flooding, limited sight-distance, hills, curves, guardrails, width of shoulder (i.e., breakdown lane), etc.
- Always remain aware of an escape route -- behind an established barrier, parked vehicle, guardrail, etc.
- Always pay attention to moving traffic – never assume drivers are looking out for you
- Work as far from traveled way as possible to avoid creating confusion for drivers.

- When workers must face away from traffic, a “buddy system” should be used, where one worker is looking towards traffic.
- Review traffic control devices to ensure that they are adequate to protect your work area. Traffic control devices should: 1) convey a clear meaning, 2) command respect of road users, and 3) give adequate time for proper traffic response. The adequacy of these devices are dependent on limited sight distance, proximity to ramps or intersections, restrictive width, duration of job, and traffic volume, speed, and proximity.

8.0 Driving Safety

- Abide by all traffic laws.
- Seat belts must be worn at all times.
- Although utilizing cell phones while driving is discouraged, hands-free cell phone devices may be used when necessary. The use of hand held cell phones are strictly prohibited while driving.
- Practice defensive driving. Defensive driving starts from the moment you get behind the wheel. Always be alert to the hazards around you, including changing weather. Driving defensively means taking every possible precaution to avoid an accident, despite the hazards around you.
- Inspect your vehicle before a trip. Make sure tires are properly inflated and loads are securely tied down.
- Eliminate or reduce hazards whenever possible. Make sure that no loose items are on the dashboard or by your feet, or that items are not piled to high on seats or floors.
- Keep a safe distance from the vehicle in front of you.
- Let problem drivers move ahead of you. Do not challenge them.
- Use extra caution when driving in the winter. Clear all snow and ice from the vehicle before driving, leave plenty of room for stopping, and drive slow.
- All vehicles must be equipped with basic emergency response and safety equipment including:
  - Potable water
  - First aid kit
  - Flashlight with extra batteries
  - Anti-bacterial wipes, gel, or solution
  - Minimal personal protective equipment necessary for work at the destination, appropriate for the expected exposures

9.0 Confined Space Awareness

SDE field staff has had training in confined space awareness. Although this project does not require confine space entry, the awareness training was completed in case of an emergency situation.

10.0 Slip and Fall Protection

- Portable ladder safety: always maintain a 3-point (two hands and a foot, or two feet and a hand) contact on the ladder when climbing. Keep your body near the middle of the step and always face the ladder while climbing. Ladders must be free of any slippery material on the rungs, steps or feet. Use a ladder only on a stable and level surface, unless it has been secured (top or bottom) to prevent displacement. An extension or straight ladder used to access an elevated surface must extend at least 3 feet above the point of support. Do not stand on the three top rungs of a straight, single or extension ladder. The proper angle for setting up a ladder is to place its base a quarter of the working length of the ladder from the wall or other vertical surface. Be sure that all locks on an extension ladder are properly engaged.
- Wear shoes with non-slip soles and be particularly careful when walking on slick or icy surfaces during the winter. Extra care should also be taken to prevent slip and fall accidents when going on roofs and/or standing over open manholes.
- Employees walking in ditches, swales and other drainage structures adjacent to roads or across undeveloped land must use caution to prevent slips and falls which can result in twisted or sprained ankles, knees, and backs.
- Whenever possible observe the conditions from a flat surface and do not enter a steep ditch or side of a steep road bed.
- If steep terrain must be negotiated, sturdy shoes or boots that provide ankle support should be used. The need for ladders or ropes to provide stability should be evaluated.

11.0 Manual Lifting

- Proper lifting techniques must be used when lifting any object.
- Plan storage and staging to minimize lifting or carrying distances.
- Split heavy loads into smaller loads.
- Use mechanical lifting aids whenever possible.
- Have someone assist with the lift -- especially for heavy or awkward loads.
- Make sure the path of travel is clear prior to the lift.

12.0 Working Around Untreated Wastewater

When working around untreated wastewater, employees should exercise the following precautions:

- Do not eat or drink.
- Minimize contact with surfaces.

- Don’t touch eyes, ears, nose and mouth.
- Wash hands immediately upon leaving the site or going into office areas or vehicles. Ensure that adequate washing facilities are available for employees. For situations where hand washing facilities are not readily available, antibacterial hand gels can be used to prevent the spread of germs.
- If touching contaminated surfaces is unavoidable, wear surgical-type nitrile gloves. Carefully remove gloves by rolling them inside out, and wash hands immediately.
- Avoid shaking hands with other employees, and maintain a distance of approximately 3 feet during conversations to avoid spread of colds, flu and other contagious diseases.

13.0 Dog Safety

- Avoid all dogs – both leashed and stray.
- Don't disturb a dog while it is sleeping, eating, or caring for puppies.
- If a dog approaches to sniff you, stay still and do not reach out to the dog as it may be interpreted as an act of aggression.
- An aggressive dog has a tight mouth, flattened ears, and a direct stare.
- If you are threatened by a dog, remain calm, don't scream, and avoid direct eye contact.
- If you say anything, speak calmly and firmly.
- Don't turn and run. Try to stay still until the dog leaves, or back away slowly until the dog is out of sight or you have reached safety (e.g., vehicle, outside a gated/fenced area).
- If attacked, retreat to vehicle or attempt to place something between you and the dog.
- If you fall or are knocked to the ground, curl into a ball with your hands over your head and neck, and protect your face.
- If bitten, immediately scrub the bite site vigorously with soap and water, seek medical attention as soon as possible, and report the incident to the local authorities.

14.0 COVID-19 Pandemic

Per CDC and OSHA guidelines as of 04/15/2020.

- Stay home if sick.
- Leave the office or project site immediately and report this to supervisor via phone, text or email if flu-like symptoms are experienced.
- Stay home and inform supervisor if anyone in your household or visitors to your household have travelled to any country which has resulted in a government entity instructing them to self-quarantine within the past 14 days.

- Stay home if anyone in your household or anyone you've been in close contact with in the last 14 days is experiencing flu-like symptoms.
- Take temperature prior to leaving home. Stay home if recorded temperature is 100.3 or higher.
- Maintain a minimum of a six-foot social distance from other individuals. This includes holding meetings outside and limit the number of individuals inside project offices or trailers to ensure social distancing is always maintained.
- Wash hands frequently with soap and water or an alcohol-based sanitizer. At a minimum, this should be done at the beginning of each shift, after using the restroom, after coughing or sneezing, and prior to eating. Wash hands more frequently if you handle any items that are shared or communal items such as tools and equipment, plans, or other shared resources.
- Wear PPE when on site with other individuals. PPE includes Nitrile gloves, safety goggles and cloth mask covering nose and mouth.
- Rigorously clean all frequently touched surfaces throughout the workday. Use cleaning products typically used in these areas and follow directions on the product labels.
- Avoid touching eyes, nose and mouth with unwashed hands.
- Acknowledge and follow any additional requirements set forth by the Client.

15.0 Emergency Contacts

SDE will develop a project specific emergency contact plan. The template below will be utilized.

Medical Emergency	911		
Fire/Spill Emergency	911	Boston FD	617-343-3550
Security and Police	911	Boston PD	617-343-4200
Utilities Emergency			
Water/Sewer		BWSC	617-989-7000
Gas		NSTAR Gas	800-592-2000
Electric		NSTAR Electric	800-592-2000

16.0 Hospital Contact Information and Directions

Hospital Name/Address: Boston Medical Center
One Boston Medical Center Place
Boston, MA 02118

Hospital Phone #: 617-638-8000

Directions to the Hospital

Access by Car

From the North:
1. Follow Route 1 (Via Mystic/ Tobin Bridge) to Route 93 South.
2. Take Exit 18 (Mass Ave).
3. At traffic light, take right onto access road; stay in right lane.
4. At end of access road, turn right onto Massachusettes Ave.

For directions to your BUMC/BMC destination, please follow signs.

From the South:
1. Take Expressway North (Route 93/3).
2. Take Exit 18.
3. At the third traffic light, take left onto access road stay in right lane.
4. At end of access road, turn right onto Massachusetts Ave.

For directions to your BUMC/BMC destination, please follow signs.

From the West:
1. Take the Massachusetts Turnpike (Route 90) East to end.
2. Take Expressway South (Route 93).
3. Take Exit 18 (Mass Ave.).
4. At traffic light, take right onto access road; stay in the right lane.
5. At end of access road, turn right onto Massachusetts Ave.

For directions to your BUMC/BMC destination, please follow signs.

From Logan Airport:
1. Go through the Sumner Tunnel (Route 1A South) to Expressway South.
2. Take Expressway South (Route 93.)
3. Take Exit 18 (Mass Ave.)
4. At the traffic light, take right onto access road; stay in right lane.
5. At end of access road, turn right onto Massachusetts Ave.

INTRODUCTION

The purpose of this document is to outline field procedures to perform wet weather screening and sampling of the Boston Water and Sewer Commission's (Commission's or BWSC's) storm drain outfalls (SDOs), combined sewer overflow outfalls (CSOs), and storm drain interconnections between the Commission and storm drains owned by other Municipal Separate Storm Sewer Systems (MS4s). This document was originally developed in 2012 under Phase 3 and has been revised numerous times as the program evolved, primarily capturing changes to the list of outfalls to be screened. Appendix A provides a history of revisions. A significant update was completed November of 2020. At that time the protocols were revised to capture changes to the sample collection and analysis procedures which have occurred over time, to address locations that have not been sampled in the past due to standing water, and to include an updated health and safety plan addressing impacts of COVID-19.

The goal of the wet weather field screening program is to collect a sample at all locations where flow was not observed during dry weather screening as well as locations where dry weather flow was below all Illicit Discharge Detection and Elimination (IDDE) thresholds as defined in paragraph 11 of Section VII Remedial Measures of Civil Action No. 10-10250-RGS, and determine if the wet weather flow is contaminated. Screening will consist of recording weather conditions, observing visual and olfactory characteristics of wet weather flow, and collecting samples to be analyzed for bacteria and other parameters as discussed below.

Stacey DePasquale Engineering, Inc. (SDE), as a subcontractor to Stantec, will perform the outfall screening field work. SDE has been completing wet weather outfall screening and sampling for the Commission since 2013 and is therefore familiar with each sampling location. The current (2023) list of approved storm drain outfalls (Table B-1), interconnections (Table B-2), and CSO outfalls (Table B-3) are included in Appendix B. The interconnection sampling locations will be storm drain manholes. Each year these lists are re-generated based on the Commission's previous year dry weather screening and sampling data.

Each outfall will be identified by its unique outfall Facility ID, and interconnections will be identified by their unique manhole Facility ID, as shown in Appendix B.

WEATHER AND TIDE MONITORING

SDE will continuously monitor (and keep records of) weather forecasts as a basis for determining when a period of acceptable wet weather exists in order to mobilize field crews to perform the wet weather screening. "Screening and Sampling" as described below may proceed under the following conditions, as stipulated in paragraph 13 of Section VII Remedial Measures of Civil Action No. 10-10250-RGS:

At least 0.25 inches of rainfall in the preceding 24 hours, or precipitation event sufficient to produce flow in an outfall

SDE will use the Commission's rain gauges to confirm that wet weather conditions have been met prior to mobilizing. For tidal locations, Screening and Sampling must be performed near low tide.

SCREENING AND SAMPLING

One day prior to screening and sampling visits, SDE will notify the laboratory and the courier of the schedule for the sampling day.

A two-person field crew will conduct the screening and sampling by visiting the location of each outfall or interconnection manhole. SDE may have multiple two-person crews working simultaneously in order to visit as many locations as possible during the most ideal wet weather conditions.

Where possible, the same screening location will be used each year for wet and dry weather screening. If the same location is not accessible, field crews will locate an alternate suitable screening site. The selected screening site will be as near the outfall as possible and free of standing water or back flow from the receiving water. It is anticipated that selected manholes in these cases will be no more than three manholes or 750 feet upstream outside of backflow or tidal influence. In any case where the sampling location for wet weather screening differs from the sampling location for dry weather screening, the reason for the change will be noted in the field form.

For locations that are submerged or have standing water present[1], SDE will inspect up to three manholes directly upgradient but no more than 750 feet from the outlet. SDE will note which of these locations also has

[1]The term "submerged" is typically used only for outfalls and means that the outfall opening is below the water level of the receiving water. The term "standing water" means there is water present at the invert which is not flowing, and at least a

standing water and then, at the first upstream accessible manhole location from the outfall free of standing water, perform the same data recording and sampling as described above. If all manholes inspected upstream of the outfall contain standing water, then a sample will not be collected. Outfalls that are unable to be sampled because they are submerged or have standing water must be reported to the Commission so that an alternate sampling location may be identified. Based on historical outfall screening data, a list of outfalls that are typically submerged or have standing water are provided in Appendix C with recommendations on how to proceed which include cleaning and CCTV. In the meantime, SDE should continue to visit these outfalls and attempt to identify a suitable sampling location.

If an upstream manhole is used for screening and sampling SDE will note if there is more than one inlet to the manhole as well as the flow characteristics from each pipe. It is important at CSO outfalls to collect a sample at a manhole downstream of the regulator. Sampling at CSO outfalls should be done prior to activation of the upstream CSO regulator(s) or during a precipitation event that does not cause any upstream CSO regulator(s) to activate. At the time of sample collection, SDE will check the upstream regulator(s) to confirm that they have not activated.

All observations and activities conducted at each screening location will be recorded on the screening and sampling form included in Appendix D. Forms will be completed electronically. Data will be exported to a spreadsheet and paper reports will also be generated and posted on the project SharePoint site on a weekly basis. The information recorded on the forms will include weather conditions during, and in the 24 hours prior to, each sampling event. At each location where flow is observed, an observation of flow characteristics will be recorded (odor, color, clarity, turbidity, deposits/stains). Samples will be collected for laboratory analysis of the wet-weather flow for either *E. coli* bacteria or *Enterococcus* bacteria. Tables provided in Appendix B designate each outfall and interconnection location as discharging to fresh or marine waters. Discharges to fresh water bodies shall be sampled for *E. coli* analysis, and those discharging to marine water bodies shall be sampled for *Enterococcus* analysis.

Analytical samples collected will be labeled, sealed, and stored in ice-filled coolers. Samples will be transferred to G&L Laboratories of Quincy, MA for analysis within six hours of sample collection. Completed chains of custody will accompany each shipment to the lab. It is estimated that between 6 and 12 samples will be collected per day for a single crew, depending on distance among outfall locations. All samples will be collected in accordance with the detailed sampling procedures below.

In addition to each analytical sample collected, the field crews will estimate the flow and collect a sample for on-site evaluation of the following parameters:

- Temperature,
- pH,
- Specific conductivity,
- Surfactants,
- Ammonia,
- Total Residual Chlorine,
- Salinity

---

portion of the outfall opening is above the water level of the receiving water. Standing water occurs at both outfalls and manholes but is more common at manholes.

SAMPLING PROCEDURES

The following procedure outlines, in detail, the steps to be taken during outfall and interconnection screening and sampling:

- Prior to the start of sampling, a trip blank sample must be prepared by filling a laboratory-provided sample container with clean bottled water (distilled or bottled drinking water is acceptable). This trip blank sample will be labeled and kept in a cooler with all samples collected that particular day.
- Upon arrival at the appropriate screening location, begin a new Screening and Sampling Form. Blank forms are included in Appendix D.
- Indicate whether the screening location is a storm drain outfall, combined sewer overflow outfall, or interconnection manhole.
- Record all pertinent observational information, including a general description of flow velocity, depth of water, appearance of water, etc. *Note: flow rate will not be calculated in the field during inspections because it would significantly slow down the inspection process. However, flow can be calculated after-the-fact based on information that SDE records in the field during inspections, including the estimated velocity, the diameter of the outfall, and the approximate depth of water.*
- If outfall sampling location is a manhole, complete information related to manhole appearance and condition.
- Record the time of sampling.
- Place a clean grab sampling container into the middle of the flow stream facing upstream. Retrieve the container after it has filled and swirl the contents to coat all inside surfaces with sample water. Dump the contents of the container away from or downstream of sampling location. Repeat this twice, so that sample container is fully rinsed with sample water three times.
- Using the same method, fill and retrieve the sample container a fourth time. Gently swirl container to maintain mixing of the grab sample.
- Open the sterile container for bacterial sampling. Use caution to handle only the outside of each sample container and to maintain sterile conditions during collection of bacterial samples. Fill sterile container with sample water and seal container. If duplicate samples are being collected at a particular location, they should be poured from the same container. The appropriate analysis will be conducted at sample locations as follows:
    - *E. coli* – freshwater discharge locations;
    - *Enterococcus* – marine discharge locations.
- Verify that the sample container is properly sealed and label each sample container with sample identifier, date, time, preservative type (ice only), and initials of sampling personnel. Duplicate samples shall be labeled with a “D” preceding the sample identifier. All information shall be also recorded on the field form.
- Place sample containers in ice-filled coolers until later transport to the lab takes place.
- Conduct on-site measurements of field parameters on remaining volume in sample container. If more volume is needed, a subsequent grab sample may be collected in the manner described for analytical sample collection.
    1. Test kits will be used for field measurements of surfactants, ammonia, and total residual chlorine as follows:

- Ammonia: CHEMetrics K-1510 or Hach Ammonia (Nitrogen) test strips
- Surfactants: CHEMetrics K-9400
- Total Residual Chlorine: CHEMetrics K-2504

2. Oakton PCTSTestr50, a portable meter, will be used for measurements of pH, salinity, temperature, and specific conductivity. (Note that instrumentation shall be checked and calibrated at least bi-weekly.)

- Gently swirl the container to maintain mixing.
- Use manufacture instructions to run the sample for the required field parameters.
- Record results and time of measurements on the field form.
- Clean and store meter during travel between sampling locations.
- For any reusable sampling equipment, decontamination shall be performed as follows:
    1. Rinse equipment with a 70% isopropyl alcohol solution. Rinsate shall be collected in a bucket and disposed of properly.
    2. Rinse equipment with distilled water.
- Note that samples must be transferred to G&L Laboratories within six-hours of sample collection, and samples must be analyzed within an **eight-hour holding time** from sample collection.
- Prior to transfer to the lab, a chain of custody shall be filled out and must accompany samples at all times. The person receiving samples at the lab must sign each chain of custody.

QUALITY ASSURANCE/QUALITY CONTROL

This Quality Assurance/Quality Control (QA/QC) section will establish the data quality objectives (DQOs) for the program, as follows:

- Data must be complete and of sufficient detail to assess water quality at each screening location.
- Data should represent actual conditions at the outfall outlet or interconnection manhole inlet.
- Data should be generated by accepted sampling methodologies.
- Data must be reproducible and accurate.

The screening and sampling program has been developed to encompass these DQOs as they pertain to characterizing the physical condition and water quality at each screening location. Sampling techniques selected were based upon past methods employed in the Boston Water and Sewer Commission's monitoring programs and upon standard industry practice. Field crew members from SDE have prior experience with sample methods and equipment usage. The methods proposed for field testing are standard methods, as stated in EPA guidance (EPA, 1986; 2002; 2014). In addition, G&L Laboratories is State and EPA certified to conduct the required analyses.

Table 1-1 lists the analytical methods to be used for each of the parameters to be tested.

Table 1-1: Analytical Methods to be used for Bacterial Analysis

Parameter	Analytical Method
E. coli	EPA 1603
Enterococcus	EPA1600

Measures employed to ensure that QA/QC DQOs are met are described as follows.

Precision

Precision is the ability to obtain reproducible results when analyzing duplicate samples. The overall sampling precision will be determined by the collection and analysis of field duplicate samples that are not identified as such to the analytical laboratory. Duplicate samples will be collected for the same analysis as the parent samples. They will be assigned an identical sample identifier, except for the addition of “D” preceding the identifier. Duplicate samples are to be collected at the frequency of one per twenty samples.

Because bacteria are living organisms that reproduce and die after sample collection, some degree of disparity between the duplicate sample and the original sample is expected and not necessarily reflective of sample collection or laboratory error.

Accuracy

Accuracy is the degree of difference between a reported value and its true value. As part of ensuring sufficient accuracy, minimization of false positive and false negative analytical data is attempted.

The potential for false positive data values will be assessed through the analysis of laboratory blanks, which must be less than the method detection limit (MDL) or instrument detection limit. Each batch of samples analyzed will be run with a laboratory blank.

Accuracy will also be assessed through the use of control samples of known composition. Laboratory control samples and calibration standards will be used by the laboratory, as needed.

Representativeness

Sample collection under this program is intended to provide data representative of actual conditions at particular screening locations. In order to ensure representativeness, outfall sample locations are selected as close to actual outfall outlets as possible. Where an outfall is unsuitable for sampling at its outlet due to inaccessibility, tidal inflows, or backwater effects, locations upstream may be selected with Commission approval only. However, since grab samples are only representative of a snapshot of water quality conditions at a given point in time, they may not be representative of long-term conditions. Data collected must be evaluated while recognizing this limitation.

In addition, samples collected must be representative of water quality at the location they were taken and not be influenced by cross-contamination from other samples collected the same day and stored in the same ice cooler. In order to ensure this, trip blank samples will be collected at the start of each day by filling a laboratory-provided container with clean bottled water. This filled container will be carried throughout the day in the same ice cooler with samples collected.

Sample Handling and Custody

All filled sample containers will be placed on ice immediately following sample collection. They shall then be transported to the lab, G&L Laboratories, within six hours for analysis within 8 hours. (Note that the holding time is applicable from time of sample collection to time of analysis.) A completed chain of custody must accompany each sample shipment to the lab, and sample custody will be tracked throughout the full analytical process in the lab. These forms will be included in the analytical report to Stantec. Table 1-2 lists required types of containers and preservation for each analysis to be performed.

Table 1-2: Requirements for Sample Holding

Parameter	Container Volume	Container Type	Preservative	Holding Time
E. coli	100 mL	Sterile plastic	Cooled to <10°C	8 hours
Enterococcus	100 mL	Sterile plastic	Cooled to <10°C	8 hours

Instrument/Equipment Testing, Inspection, and Maintenance

Testing, inspection, and maintenance will be performed for all instruments and equipment to be employed for the lab analyses to be conducted as part of this program, and such activities will be done in accordance with G&L Laboratories' quality procedures.

All field sampling equipment and instrumentation will be inspected on a regular basis, and preventative maintenance will be performed. Prior to mobilization to the field sites, equipment and instrumentation will be checked and calibrated in the office. Following each sampling event, all field equipment and instrumentation will be cleaned and stored properly.

Performance Audits and Corrective Actions

Periodic audits of the field program will be conducted by Stantec at the start of the screening and sampling activities and on a random basis to evaluate adherence to and appropriateness of QA/QC requirements in the field. If unacceptable conditions are noted, Stantec and SDE will initiate corrective actions together. These corrective actions may include:

- Re-analyzing samples (if holding times permit doing so);
- Re-sampling and subsequent analysis;
- Evaluating and amending sampling and analytical procedures;
- Accepting potentially flawed data with acknowledgement of uncertainty or inaccuracy by flagging of data and providing a qualifying explanation.

GENERAL FIELD REQUIREMENTS AND SAFETY

Any major blockages, collapses, or defects to the storm drainage system or sanitary sewer system (that may pose a public health and safety threat) observed during any field operations will be reported to the Commission within 48 hours.

Field crews are authorized to request a police detail for personal safety reasons at any time.

SDE's Health and Safety Plan is provided in Appendix E and has been updated to include COVID-19 protocols. The Commission does not require safety vests to be issued by the Commission, but crews must have safety vests and they must be worn in the field.

APPENDIX A

History of Revisions to Wet Weather Outfall Screening Protocols

APPENDIX A

History of Revisions to Wet Weather Outfall Screening Protocols

10/9/2020	CWI5 Kickoff Updates: • Stantec review of EPA Methods 1600 and 1603 revised 2014 (prior protocols based on 2002 versions). Revisions made accordingly, including update of sample holding time to clarify that samples must be delivered to the lab within 6 hours from the time of sample collection and analyzed by the lab within 8 hours from the time of sample collection. Also updated sample preservation temperature from 4 ^{o}C to <10 ^{o}C. • Updated field instrument and test kit manufacturer/model, and calibration frequency • Removed Appendix C, "Wet Weather Screening of CSOs Memorandum". No longer needed; SDE samples as close to the 0.25 inch wet threshold making sure that the rainfall intensity is not too high. • Additional information/guidance provided for locations that are consistently submerged or have standing water present during wet weather screening • Updated Outfall Screening Form • Added SDE Health and Safety Plan, including information about COVID safety measures
5/7/2020	9BSDO049 has been added to the 2020 list of outfalls to be screened for wet weather, in response to observations made by the Charles River Watershed Association.
2/21/2017	19MCSO083 has been abandoned and does not need to be screened anymore.
4/11/2014	Remove 7HSDO287 from the list because during 2013 dry weather screening SDE determined that this outfall is no longer active; the outlet from the upstream catch basin has been bricked and flows are directed to 7HSDO285.
3/13/2014	Replaced 26KSDO245 with 26KSDO254. It was determined that 26KSDO245 belongs to DCR.
2/19/2014	Updated the Facility ID and Feature ID for 25MCSO007, 26JCSO049, and 21NCSO80.
1/20/2014	Added outfall 24CSDO039 to replace interconnection 24CMH14, which was sampled in 2012 and 2013.
9/10/2013	Added 7HSDO287 to the list with screening not required per BWSC request. Also added a comment field to the SDO table and included 12BMH032 as the recommended manhole for sampling for 12BSDO033 and 12BSDO031.
9/5/2013	Updated protocols with new lists of SDOs, CSOs, and interconnections for 2013 wet weather screening

4/12/2013	Added CSO 19N081 to the approved CSO screening list. Updated Facility ID for 7CSDO006.
3/25/2013	Added CSOs to the approved outfall list and added the 3/5/2013 Wet Weather Screening of CSOs memorandum for reference.
3/5/2013	Added language regarding wet weather sample collection at CSO outfalls (SDE must check the upstream regulator(s) at the time of sampling to confirm that the regulator(s) have not activated).
2/13/2013	Table A-2 in Appendix A has been updated to change 28MMH15 to 28IMH15. Despite the label being incorrect, the correct manhole was sampled in the past.
2/12/2013	SDE was reminded to collect field duplicate samples in one container and then pour from the one container into two separate sample bottles. Prior to this field duplicates had been collected separately.
1/8/2013	Added Facility ID to the Tables in Appendix A
12/7/2012	Original document created

15.0 Emergency Contacts 8
16.0 Hospital Contact Information and Directions 8
17.0 Signatures 8

1.0 General Safety

While in the office or out in the field, all SDE personnel are to refrain from using horseplay and distracting others. Horseplay, scuffling, distraction of fellow workers, throwing of objects, running, and practical jokes may lead to serious injuries. Possession, consumption, or being under the influence of alcohol or drugs is also prohibited during working hours.

- Conduct a daily site hazard review each morning. Document the review using the Daily Hazard Review Meeting survey.
- Conduct an equipment check each morning. Document any issues found using the Daily Hazard Review Meeting survey. Tools, equipment, and supplies should be in good working order without any noticeable signs of damage or structural wear. If damage or wear is noticed a supervisor should be notified and equipment should be replaced prior to use.
- Conduct a check on all personal protective equipment to be used each morning. Document the check using the Daily Hazard Review Meeting survey. If any issues are found a supervisor should be notified. Personal protective equipment should be replaced before use.
- Site work should be performed during daylight hours whenever possible. Work conducted during hours of darkness require enough illumination intensity to read a newspaper without difficulty.
- Good housekeeping must be maintained at all times in all project work areas.
- Common paths of travel should be established and kept free from the accumulation of materials.
- Tools, equipment, materials, and supplies shall be stored in an orderly manner.
- As work progresses, scrap and unessential materials must be neatly stored or removed from the work area.

If unsafe conditions are present, SDE personnel have authority to stop work immediately. Hazardous conditions should be reported to supervisor as soon as it can be done safely.

2.0 Personal Security and Crime Prevention

While conducting your work stay alert, become familiar with your surroundings, report any activity/circumstances that you feel is unusual and always stay in frequent contact with other project personnel. Use the following to help protect yourself from danger while in/out of your vehicle, working alone or in an unsafe area:

- Avoid working alone as much as possible.
- When working at night on the project, plan for extra precautions such as additional lighting, security, police presence or escorts when leaving the project.
- If you are a witness or the victim of a crime, an accident or suspicious/threatening circumstances, report it to the Police as soon as possible.

- Always lock your car doors while driving, and roll windows up far enough to keep anyone from reaching inside.
- At stop signs and lights keep the car in gear, windows rolled up, doors locked and stay alert.
- Travel well-lighted, busy streets. You can spare those extra minutes it may take to avoid an unsafe area.
- Keep your wallet/purse, laptop, and other valuable out of sight, even when you are driving in your locked car.
- Park in safe, well-lighted areas near your destination.
- Always let a project member know where you are and your destination if you must travel alone.
- Always lock your car, even for a short absence. And before unlocking your car, quickly check to make sure no one is hiding on your seats or floors of your vehicle.
- If your car should break down:
  - Get off the roadway, out of the path of oncoming traffic, even if you have to drive on a flat tire. The tire is replaceable.
  - Turn on your emergency flashers.
  - If a motorist stops to render assistance, it is better to remain in the car, and ask them to get help.
  -

3.0 Working Alone

Working alone may not be hazardous in itself, but the work conditions or tasks to be performed on a project site may affect a person's ability to safely perform the work alone or to receive assistance in the event of an emergency.

Personnel can be assigned to work alone only by their project manager, who must assess potential hazards and appropriate control measures.

Listed below are some examples, not all-inclusive, of workplace conditions that must be considered and impact the ability of the employee to safely work alone:

- Is the amount of time needed for the employee to complete the task reasonable, or will fatigue become a factor?
- Do tasks include handling and lifting materials; operating machinery or powered tools; maintaining electrical, pneumatic, or steam powered systems; or working with hazardous substances?
- Is access to the work area difficult, requiring working at heights, below ground, or in structures that are difficult to enter or exit?

- Does the work location present a risk of violence to the employee; require travel off public roads through desolate or steep terrain; or involve work at a remote location or over or near rivers, pools, or lakes?
- What are the environmental conditions, such as temperature extremes or weather conditions?
- Must the work be performed beyond normal business hours or on weekends or holidays?
- Is the person working alone able to communicate with another employee in the event of an emergency or are emergency services readily available?

Examples (not all-inclusive) of precautionary or control measures that can be used to address the conditions or hazards of working alone:

- Conducting a review of the work schedule to determine whether the task could be completed during a time when the employee does not have to work alone.
- Establishing a communication process that will reliably allow contact with the employee working alone, requires check-in at designated time intervals, includes response actions when communication is lost or check-in is not completed, and verifies the employee has returned to their base of operation after completing the task.
- Requiring supervisors to periodically visit and observe worksites where employees work alone.
- Issuing the proper personal protective equipment (PPE) to the employee and ensure it is maintained in acceptable condition.
- Ensuring emergency supplies are provided for employee to use in event of fire, injury/illness, or survival provisions when working in a remote area.

4.0 Personal Protective Equipment

- Long pants, safety shoes (steel toe with non-skid soles), and safety vests are to be worn at all work sites unless specifically instructed otherwise.
- Hard hats to be worn in all construction zones although none are anticipated to be encountered during this project.
- Latex gloves are to be used when handling bacteria samples.
- Conduct a daily check of all PPE to be used to ensure it is in good condition. If anything is not in good working order it should be replaced before use. Checks should include:
    - Check latex gloves to ensure that they are not damaged. Check for holes, yellowing or other defects.
    - Check work gloves to ensure there is no noticeable damage including holes or fraying.
    - Check safety vest to ensure that they are clean, and that reflective material is not damaged.
    - Check safety cones for structural damage. Also check the reflective material to ensure it is in good condition and not damaged, discolored or peeling off.

- Check expiration date on bug spray.
- Check expiration date on Tecnu.

5.0 Cold Stress

- Be aware of the symptoms of cold-related disorders, and wear proper, layered clothing for the anticipated fieldwork. Appropriate rain gear is a must in cool weather.
- Monitor the work conditions and adjust the work schedule as needed.

6.0 Heat Stress

- Drink 16 ounces of water before beginning work. Under severe conditions, drink 1 to 2 cups every 20 minutes, for a total of 1 to 2 gallons per day. Do not use alcohol in place of water or other nonalcoholic fluids. Decrease your intake of or avoid consumption of coffee, carbohydrate-rich beverages, and caffeinated soft drinks during working hours.
- Acclimate yourself by slowly increasing workloads (e.g., do not begin with extremely demanding activities).
- Conduct field activities in the early morning or evening and rotate shifts of workers, if possible.
- Avoid direct sun whenever possible, which can decrease physical efficiency and increase the probability of heat stress. Take regular breaks in a cool, shaded area.

7.0 Roadway Work Safety

Work along/in roadways must be done according to local/state/federal requirements.
The following precautions must be taken when working around traffic:

- Exercise caution when exiting traveled way or parking along street – avoid sudden stops, use flashers, etc.
- Park in a manner that will allow for safe exit from vehicle, and where practicable, park vehicle so that it can serve as a barrier.
- All staff working adjacent to traveled way or within work area must wear the appropriate ANSI/ISEA 107-2004 high-visibility safety vests.
- Remain aware of factors that influence traffic related hazards and required controls – sun glare, rain, wind, flash flooding, limited sight-distance, hills, curves, guardrails, width of shoulder (i.e., breakdown lane), etc.
- Always remain aware of an escape route -- behind an established barrier, parked vehicle, guardrail, etc.
- Always pay attention to moving traffic – never assume drivers are looking out for you
- Work as far from traveled way as possible to avoid creating confusion for drivers.

- When workers must face away from traffic, a “buddy system” should be used, where one worker is looking towards traffic.
- Review traffic control devices to ensure that they are adequate to protect your work area. Traffic control devices should: 1) convey a clear meaning, 2) command respect of road users, and 3) give adequate time for proper traffic response. The adequacy of these devices are dependent on limited sight distance, proximity to ramps or intersections, restrictive width, duration of job, and traffic volume, speed, and proximity.

8.0 Driving Safety

- Abide by all traffic laws.
- Seat belts must be worn at all times.
- Although utilizing cell phones while driving is discouraged, hands-free cell phone devices may be used when necessary. The use of hand held cell phones are strictly prohibited while driving.
- Practice defensive driving. Defensive driving starts from the moment you get behind the wheel. Always be alert to the hazards around you, including changing weather. Driving defensively means taking every possible precaution to avoid an accident, despite the hazards around you.
- Inspect your vehicle before a trip. Make sure tires are properly inflated and loads are securely tied down.
- Eliminate or reduce hazards whenever possible. Make sure that no loose items are on the dashboard or by your feet, or that items are not piled to high on seats or floors.
- Keep a safe distance from the vehicle in front of you.
- Let problem drivers move ahead of you. Do not challenge them.
- Use extra caution when driving in the winter. Clear all snow and ice from the vehicle before driving, leave plenty of room for stopping, and drive slow.
- All vehicles must be equipped with basic emergency response and safety equipment including:
  - Potable water
  - First aid kit
  - Flashlight with extra batteries
  - Anti-bacterial wipes, gel, or solution
  - Minimal personal protective equipment necessary for work at the destination, appropriate for the expected exposures

9.0 Confined Space Awareness

SDE field staff has had training in confined space awareness. Although this project does not require confine space entry, the awareness training was completed in case of an emergency situation.

10.0 Slip and Fall Protection

- Portable ladder safety: always maintain a 3-point (two hands and a foot, or two feet and a hand) contact on the ladder when climbing. Keep your body near the middle of the step and always face the ladder while climbing. Ladders must be free of any slippery material on the rungs, steps or feet. Use a ladder only on a stable and level surface, unless it has been secured (top or bottom) to prevent displacement. An extension or straight ladder used to access an elevated surface must extend at least 3 feet above the point of support. Do not stand on the three top rungs of a straight, single or extension ladder. The proper angle for setting up a ladder is to place its base a quarter of the working length of the ladder from the wall or other vertical surface. Be sure that all locks on an extension ladder are properly engaged.
- Wear shoes with non-slip soles and be particularly careful when walking on slick or icy surfaces during the winter. Extra care should also be taken to prevent slip and fall accidents when going on roofs and/or standing over open manholes.
- Employees walking in ditches, swales and other drainage structures adjacent to roads or across undeveloped land must use caution to prevent slips and falls which can result in twisted or sprained ankles, knees, and backs.
- Whenever possible observe the conditions from a flat surface and do not enter a steep ditch or side of a steep road bed.
- If steep terrain must be negotiated, sturdy shoes or boots that provide ankle support should be used. The need for ladders or ropes to provide stability should be evaluated.

11.0 Manual Lifting

- Proper lifting techniques must be used when lifting any object.
- Plan storage and staging to minimize lifting or carrying distances.
- Split heavy loads into smaller loads.
- Use mechanical lifting aids whenever possible.
- Have someone assist with the lift -- especially for heavy or awkward loads.
- Make sure the path of travel is clear prior to the lift.

12.0 Working Around Untreated Wastewater

When working around untreated wastewater, employees should exercise the following precautions:

- Do not eat or drink.
- Minimize contact with surfaces.

- Don’t touch eyes, ears, nose and mouth.
- Wash hands immediately upon leaving the site or going into office areas or vehicles. Ensure that adequate washing facilities are available for employees. For situations where hand washing facilities are not readily available, antibacterial hand gels can be used to prevent the spread of germs.
- If touching contaminated surfaces is unavoidable, wear surgical-type nitrile gloves. Carefully remove gloves by rolling them inside out, and wash hands immediately.
- Avoid shaking hands with other employees, and maintain a distance of approximately 3 feet during conversations to avoid spread of colds, flu and other contagious diseases.

13.0 Dog Safety

- Avoid all dogs – both leashed and stray.
- Don't disturb a dog while it is sleeping, eating, or caring for puppies.
- If a dog approaches to sniff you, stay still and do not reach out to the dog as it may be interpreted as an act of aggression.
- An aggressive dog has a tight mouth, flattened ears, and a direct stare.
- If you are threatened by a dog, remain calm, don't scream, and avoid direct eye contact.
- If you say anything, speak calmly and firmly.
- Don't turn and run. Try to stay still until the dog leaves, or back away slowly until the dog is out of sight or you have reached safety (e.g., vehicle, outside a gated/fenced area).
- If attacked, retreat to vehicle or attempt to place something between you and the dog.
- If you fall or are knocked to the ground, curl into a ball with your hands over your head and neck, and protect your face.
- If bitten, immediately scrub the bite site vigorously with soap and water, seek medical attention as soon as possible, and report the incident to the local authorities.

14.0 COVID-19 Pandemic

Per CDC and OSHA guidelines as of 04/15/2020.

- Stay home if sick.
- Leave the office or project site immediately and report this to supervisor via phone, text or email if flu-like symptoms are experienced.
- Stay home and inform supervisor if anyone in your household or visitors to your household have travelled to any country which has resulted in a government entity instructing them to self-quarantine within the past 14 days.

- Stay home if anyone in your household or anyone you've been in close contact with in the last 14 days is experiencing flu-like symptoms.
- Take temperature prior to leaving home. Stay home if recorded temperature is 100.3 or higher.
- Maintain a minimum of a six-foot social distance from other individuals. This includes holding meetings outside and limit the number of individuals inside project offices or trailers to ensure social distancing is always maintained.
- Wash hands frequently with soap and water or an alcohol-based sanitizer. At a minimum, this should be done at the beginning of each shift, after using the restroom, after coughing or sneezing, and prior to eating. Wash hands more frequently if you handle any items that are shared or communal items such as tools and equipment, plans, or other shared resources.
- Wear PPE when on site with other individuals. PPE includes Nitrile gloves, safety goggles and cloth mask covering nose and mouth.
- Rigorously clean all frequently touched surfaces throughout the workday. Use cleaning products typically used in these areas and follow directions on the product labels.
- Avoid touching eyes, nose and mouth with unwashed hands.
- Acknowledge and follow any additional requirements set forth by the Client.

15.0 Emergency Contacts

SDE will develop a project specific emergency contact plan. The template below will be utilized.

Medical Emergency	911		
Fire/Spill Emergency	911	Boston FD	617-343-3550
Security and Police	911	Boston PD	617-343-4200
Utilities Emergency			
Water/Sewer		BWSC	617-989-7000
Gas		NSTAR Gas	800-592-2000
Electric		NSTAR Electric	800-592-2000

16.0 Hospital Contact Information and Directions

Hospital Name/Address: Boston Medical Center
One Boston Medical Center Place
Boston, MA 02118

Hospital Phone #: 617-638-8000

Directions to the Hospital

Access by Car

From the North:
1. Follow Route 1 (Via Mystic/ Tobin Bridge) to Route 93 South.
2. Take Exit 18 (Mass Ave).
3. At traffic light, take right onto access road; stay in right lane.
4. At end of access road, turn right onto Massachusettes Ave.

For directions to your BUMC/BMC destination, please follow signs.

From the South:
1. Take Expressway North (Route 93/3).
2. Take Exit 18.
3. At the third traffic light, take left onto access road stay in right lane.
4. At end of access road, turn right onto Massachusetts Ave.

For directions to your BUMC/BMC destination, please follow signs.

From the West:
1. Take the Massachusetts Turnpike (Route 90) East to end.
2. Take Expressway South (Route 93).
3. Take Exit 18 (Mass Ave.).
4. At traffic light, take right onto access road; stay in the right lane.
5. At end of access road, turn right onto Massachusetts Ave.

For directions to your BUMC/BMC destination, please follow signs.

From Logan Airport:
1. Go through the Sumner Tunnel (Route 1A South) to Expressway South.
2. Take Expressway South (Route 93.)
3. Take Exit 18 (Mass Ave.)
4. At the traffic light, take right onto access road; stay in right lane.
5. At end of access road, turn right onto Massachusetts Ave.
